I. Subcation and also has effects on the permeability of blood midration and also has effects on the permeability of blood midration and also in the factor as vessels. May function in the formation of the venous and lymphatic vascular systems during embryogenesis, and also in the maintenance of differentiated lymphatic endothelium in adults. Binds and activates WEGFR-2 (FHK.) and VEGFR-3 (FH.4) receptors.

I. SUBCELLULAR LOCATION: Secreted.

I. SUBCELLULAR LOCATION: Secreted.

I. SUBCELLULAR LOCATION: Secreted.

I. TISSUE SPECIFICITY: Highly expressed in lung, heart, small colon, and pancreas.

I. TISSUE and VEGFR-2. VEGF-D first form an antiparallel homodimer.

I. Privi. Undergoes a complex proteolytic maturation which generates a variety of processed secreted forms with increased activity toward vegrR-3 and VEGFR-2. VEGF-D first form an antiparallel homodimer.

I. Inked by disulfide bonds before secretion. The fully processed bonds before secretion. The fully brocessed bonds before secretion. The fully brocessed bonds before secretion.

II. STMILARITY: Belongs to the PDGF/VEGF growth factor family.

INDUCTION: By the transcription factor c-fos.

NDUCTION: By the transcription factor c-fos.

For Undergoes a complex proteolytic maturation which generates a variety of processed secreted forms with increased activity toward VEGFR-3 and VEGFR-2. VEGF-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed vEGF-D is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions (By similarity).

SIMILARITY: Belongs to the PDGF/VEGF growth factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PROSITE; PS00249; PDGF 1; 1.

Vascular endothelial growth factor C precursor (VEGF-C) (Vascular endothelial growth factor related protein) (VRP) (Flt4 ligand) (Flt4-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
VEGF-C first form an antiparallel homodimer linked by disulfide bonds. Before secretion, a cleavage occurs between arg-227 and ser-228 producing an heterotetramer. The next extracellular step of the processing removes the N-terminal propeptide. Finally the mature VEGF-C is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions (By similarity). SIMILARITY: Belongs to the PDGF/VEGF growth factor family.
                                                                                                                                                                                                                                                                                                                                                                   Pfam; PP00341; FUGE; 1.

May function in angiogenesis of the venous and lymphatic vascular systems during embryogenesis, and also in the maintenance of differentiated lymphatic endothelium in adults. Binds and activates VEGFR-2 (FIK1) and VEGFR-3 (FIK4) receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TISSUE=Glial tumor;

-: SUBGRELLUIAN LOCARION. Secreted.
-: TISSUE SPECIFICITY: Spleen, lymph node, thymus, appendix, bone marrow, heart, placenta, ovary, skeletal muscle, prostate, testis, colon and small intestine and fetal liver, lung and kidney, but not in peripheral blood lymphocyte.
-: PTM: Undergoes a complex proteolytic maturation which generates a variety of processed secreted forms with increased activity toward VEGTR-3, but only the fully processed form could activate VEGFR-2. VEGTR-3, but only the fully processed form could activate VEGFR-2. VEGTR-3, but only the fully processed form could activate VEGFR-2. VEGFR-3, but only the fully brocessed form could activate VEGFR-2. VEGFR-3, but only the fully brocessed form could activate VEGFR-2. VEGFR-3, but only the fully brocessed cocurs between arg-22 and set-228 producing an heterotetramer. The next extracellular step of the processing removes the N-terminal propeptide. Finally the mature VEGF-C is composed mosely of two VEGF homology domains (VHDs) bound by non-covalent interactions.
                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                        "Structural analysis of Arabidopsis thaliana chromosome 5. V. Sequence features of the regions of 1,381,565 bp covered by twenty one physically assigned Pl and TAC clones.";
DNA Res. 5:131-145(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Unpublished observations (DEC-2001).
-!- FUNCTION: Causes loosening and extension of plant cell walls by disrupting noncovalent bonding between cellulose microfibrils and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -1. SUBCELLULAR LOCATION: Cell-wall bound.
-1. SIMILARITY: Belongs to the expansin family.
-1. SIMILARITY: Contains 1 expansin-like EG45 domain.
-1. SIMILARITY: Contains 1 expansin-like EG45 domain.
-1. CAUTION: Ref.1 sequence differs from that shown due to erroneous gene model preddiction.

FUNCTION: This protein functions as a defense against chitin containing fungal pathogens.
CATALYTIC ACTIVITY: Hydrolysis of the 1,4-beta-linkages of Nacetyl-D-glucosamine polymers of chitin.
SUBCELLULAR LOCATION: Vacuolar and protoplast.
IISSUE SPECIFCITY: High constitutive level in roots with lower levels in leaves and flowering shoots.
INDUCTION: Ethylene induces high levels of systemic expression of basic chitinase with expression increasing with plant age.
SIMILARITY: Belongs to chitinase class IA (family 19 of glycosyl

(LUDW-) LUDWIG INST CANCER RES

Cendron A; Ś Stacker Hughes RA, Achen MG,

WPI; 2001-442248/47.

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 59; Page 32; 102pp; English.

```
Locyclasation are used to interfere with any department of the condition characterised by angiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy.

The condition is diabetic retinopathy, psoriasis, arthropathy.

Cerebrovascular accident, post-angioplasty restencis, head, heat or cold traum, substance-induced medvascularisation of the liver, excessive trauma, substance-induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability or nammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. Or -D and are also used in combination with an anti-inflammatory agent, to treat a
The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides from some peptides. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "A disulfide bond forms between residue 17 and residue 1 of the sequence appearing as AAU04528, forming a dimeric peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chronic inflammation, especially rheumatoid arthritis, psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; VEGF; vascular endothelial growth factor; angiogenesis; neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis;

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGEPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-ce beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the peptide by oxidising the peptide by oxidising the cyclic peptides. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis.

CC peptides) and a cyclic peptide with at least one amino acid deleted prior co-cyclication are used to interfere with anglogenesis.

CC peptides and acyclic peptide with a condition characterised by anglogenesis, neovascularisation or lymphangiogenesis.

CC recondition is diabetic retinopathy, postiasis, arthropathy, cerebrovascular accident, post-angloplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive to remone-related anglogenic dysfunction, diabetes induced neovascular conficent accumulation in pertiples are also used to modulate vascular permeability in a committee. The monomeric and bicyclic peptides are used to image blood vessels and lymphatic contraction. The peptides are used to image blood vessels and lymphatic contraction in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic contraction in peripheral limbs or in lungs, peritoneal cavity, bleura, are also used in combination with an anti-inflammatory agent, to treat a continuation inflammatory agent, to treat a continuation inflammatory agent, to treat a continuation inflammatory and arthritis, psoriasis and
                                                                                                                        Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human versely (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betactor beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide with at least one amino acid deleted prior of cyclisation are used to interfere with anglogenesis, convexicularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, chearacterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-aminoplasty restenosis, head, heat or cold carebrovascular accident, post-aminoplasty restenosis, head, heat or crebrovascular accident, post-aminoplasty restenosis, head, heat or crebrovascular accident, post-aminoplasty restenosis, head, heat or cold hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere care used to interfere care also used in combination with an anti-inflammatory agent, to treat a care incertional inflammatory agent, to treat a care incertional partition with an anti-inflammatory pager, yespecially reteriors in the peptides are also u
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 26; Page 49; 102pp; English.

The Sequence represents a commenter Director of the invention, whose 3 dimensional structure is modelled on the expose loop of human UNGED (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides by oxidising the periode of growth factor protein and cyclising the peptide by oxidising the periode comprising 2 linked monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

Co cyclisation are used to interfere with angiogenesis.

Co continuous acided to interfere with angiogenesis.

Characterised by angiogenesis, neovascularisation or lymphangiogenesis.

Che condition is diabetic retinopathy, psoriasis, arthropathy, chemangioma, vascularised malignant or benjan tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold traums, substance-induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and cheromic inflammation with an anti-inflammatory agent, to treat a chronic inflammation in peripherally with an enti-inflammatory agent, to treat a chronic inflammation in peripherally with an enti-inflammatory agent, to treat a chronic inflammation in peripherally with an enti-inflammatory agent, to treat a chronic inflammation inflammation with an enti-inflammatory accumulation with an enti-infl sequence represents a dimeric bicyclic peptide of the invention, inflammation, especially rheumatoid arthritis, psoriasis

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CV WighPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betaction exparation distances on opposite antiparallel strands of a petide loop fragment from an exposed loop of a growth factor protein and cyclic peptide by oxidising the cycleine residues. The monocyclic peptides, dimeric bicyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, covascularisation or lymphangiogenesis in a mammal with a condition of cyclisation is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive correction. The oppliedes are also used to modulate vascular permeability in fection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human NGEDD (vascular endothellal growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic
                                                                                                                                                                                       o

to cyclisation are used to interfer with angiogenesis,

neovascularisation or lymphangiogenesis in a mammal with a condition
characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, archropathy,
bemangioma, vascularised malignant or benign tumour, post-recovery
cerebrovascular accident, post-angioplasty restenosis, head, heat or cold
trauma, substance-induced neovascularisation of the liver, excessive
hormone-related angiogenic dysfunction, diabetes induced neovascular
confection. The peptides are also used to modulate vascular permeability
in a mammal (the mammal has a condition characterised by fluid
communation in peripheral limbs or in lungs, peritoneal cavity, pleura,
or brain. The peptides are used to image blood vessels and lymphatic
vasculature. The monomeric and bicyclic peptides are used to interfere
are also used in combination with an anti-inflammatory agent, to treat a
chronic inflammation, especially rheumatoid archritis, psoriasis and

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CV WEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

CC peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

CC peptides and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC crebrovascular accident, post-angioplasty restenosis, head, heat or claumer condition is diabeted resident to be benign tumour, post-recovery created angiogenic dysfunction, diabetes induced neovascular created angiogenic dysfunction, diabetes induced neovascular created accumulation in pertipheral limbs or in lungs, peritoned accumulation in pertipheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere covery cor brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere covery cor brain combination with an anti-inflammatory agent, to treat a corporation in perinonary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
  from an exposed loop of a growth factor protein by oxidizing the cysteine

or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine Novel monomeric monocyclic peptide, used to interfere with anglogenesis, WPI; 2001-442248/47 residues 

The sequence represents Human VEGF-D (vascular endothelial growth factor)

amino acids Val101-Thr 173, used together with the C-terminal 23 residues

of VEGF to make a hybrid theoretical molecule for 3 dimensional

modelling. The sequence is used in a method of producing a monomeric

monocyclic peptide by a measuring beta-beta carbon separation distances

con opposite antiparallel strands of a peptide loop fragment from an

exposed loop of a growth factor protein and cyclising the peptide by

cxidising the cysteine residues. The monocyclic peptides dimeric

betyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic

cyclic peptide with at least one amino acid deleted prior to cyclisation are

used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition of a racterised by

angiogenesis, neovascularisation or lymphangiogenesis. The condition is

diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised

conditional paths are sequelae, neovascular sequelae, hypertension induced

neovascularisation of the liver, excessive hormone-related angiogenic

dysfunction, diabetes induced neovascular sequelae, hypertension induced

neovascular sequelae, or chronic liver infection. The peptides are also

used to modulate vascular permeability in a mammal (the mammal has a

condition characterised by filled accumulation in peripheral limbs or in

condition characterised by filled accumulation in peripheral. lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy Example 1; Page 90-91; 102pp; English Sequence 73 AA;

                                                                                                                                                                         The present sequence represents human vascular endothelial growth factor (VEGF)-D. The specification describes a human cell line which stably expresses VEGF-D, or fragments/analogues having VEGF-D biological activity. VEGF-D antagonists, e.g. antisense nucleic acids or triplex activity. VEGF-D antagonists, e.g. antisense nucleic acids or triplex DNA, VEGF-D variants or antibodies (especially chimeric antibodies), are useful for the treatment or alleviation of malignant melanomas, tumours or psoriasis. Angiogenesis and lymphagiogenesis stimulating amounts of vEGF-D can be administered to enhance the acceptance and/or healing of skin grafts or to stimulate the healing of a surgical or traumatic wound to the skin. Lymphagiogenesis stimulating amounts of vEGF-D can be used to treat scheroderma. Vascularisation stimulating amounts of vEGF-D are used to treat anhydrotic ectodermal dysplasia. VEGF-D antibodies are useful for detecting tumours expressing vEGF-D. Fully.

The consense of vEGF-D can be used to stimulate at least one VEGF-D bloactivity chosen from endothelial cell proliferation, migration, survival and differentiation and lymphangiogenesis without inducing vascular

(Vascular endothelial growth factor D), lacking both the N- and C-terminal regions. The invention relates to a monoclonal antibody, or fragments thereof, which is specifically reactive with the truncated human VEGF-D, and methods of preparing the antibody. The antibody of the invention interferes with the binding of VEGF-D to the VEGF receptors. VEGFR-2 and VEGFR-3, but does not interfere with the binding of VEGF to these receptors and additionally is not reactive with VEGF-C. The antibody may be used to treat disorders associated with vascular permeability, endothelial cell proliferation, angiogenesis, lymphangiogenesis, neovascularisation and endothelial cell. Wifferentiation, especially cancer, diabetic retinopathy, psoriasis, and arthropathies. The antibody may also be used to treat fluid accumulation in the heart and/or lung via modulation of vascular permeability. It may additionally be used to detect VEGF-D and may be used to image lymphatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        o,
                                                                                                                                                                                                     Novel compositions comprising antibodies reactive to vascular endothelial growth factor-D, useful for treating, e.g. angiogenesis, lymphogiogenesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, single-chain, extracellular ligand-binding domain, VEGF, vascular endothelial growth factor, VEGF type 2 receptor, KDR; Flt-4; VEGF type 3 receptor; VEGF-C; VEGF-D; signal transduction, angiogenesis;

This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial growth factor (VEGF) type 2 receptor (RDR) or VEGF type 3 receptor (FIL-G). The polypeptide of the invention comprises two receptor-binding sites of which one is capable of binding to a ligand-binding domain of the receptor, and at least one monomer of the dimeric domain of the receptor, and at least one monomer of the dimeric polypeptide is derived from VEGF. VEGF-C or VEGF-D, where the polypeptide is capable of binding to the receptor, but incapable of activating the receptor. The polypeptide of the invention is useful for preparing a medicament for preventing or treating a disease or condition involving increased signal transduction from, or an increased activation of a VEGF-D increased signal transduction from, or an increased activation of a VEGF-D invented in the construction of a VEGF-D monomer which can be modified and used in the construction of a VEGF-D monomer which can be modified in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "This wild-type residue is replaced by Arg or Glu in the first monomer unit of the VEGF-D dimer if the E57R mutation has not occurred (see Claim 16) and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; single-chain; extracellular ligand-binding domain; VEGF;

Gaps ; 0 Novel single-chain dimeric polypeptide for inhibiting angiogenesis, binds to extracellular ligand-binding domain of vascular endothelial growth factor type 2/type 3 receptor but does not activate the receptor.

Claim 11; Page; 71pp; English.

This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial commoder to the polypeptide of the invention comprises two receptor (PIT-C 4). The polypeptide of the invention comprises two receptor-binding sites of which one is capable of binding to a ligand-binding domain of the receptor, and at least one monomer of the dimeric domain of the receptor, and at least one monomer of the dimeric collapseptide is derived from VEGF. VEGF-C or VEGF-D, where the polypeptide of the invention is useful for preparing a receptor. The polypeptide of the invention is useful for preparing a receptor. The polypeptide of the invention is useful for preparing a medicament for preventing or treating a disease or condition involving increased signal transduction from, or an increased activation of a VEGF or type 2 or type 3 receptor e.g. for inhibiting angiogenesis or type 3 receptor e.g. for inhibiting angiogenesis or type 2 receptor e.g. for inhibiting angiogenesis or type 2 receptor e.g. for inhibiting angiogenesis or type 2 receptor e.g. for inhibiting angiogenesis or type 2 receptor e.g. for inhibiting angiogenesis or type 2 receptor e.g. for inhibiting angiogenesis or disclosure of the invention. In one instance a polypeptide is claimed comparising a first monomer derived from the apolypeptide is claimed comprising at least one mutation selected from the group consisting of N37R, T38T, F39R and F40R. In a second instance a polypeptide is claimed comprising a first monomer containing a substitution consisting of S10R, S10R and E57R (although the residue at position 10 is an Ile), and/or in

ó
thus prevent the growth and development of cancers such as cancer of the brain, breast, intestine, kidney, lung, ovary, pancreas, prostate or uterus. The products of the invention can be used for gene therapy. This sequence represents the human NVR protein described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                          vascular endothelial growth factor; VEGF-D; angiogenesis; modification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated vascular endothelial growth factor-D - used to develop products for use in e.g. modifying angiogenesis or treating lung, heart or intestinal disorders.
                                                                                                                                                                                                                                                                                                                                                     acceleration, wound healing, tissue; organ; transplants; collateral circulation; infarction; arterial stenosis; coronary artery disease; inhibition; cancer; treatment; diabetic retinopathy; lung disorders, blood circulation; gaseous exchange; chronic obstructive airway disease; intestinal malabsorptive syndrome; blopsy; metastatic risk; detection; diagnosis; congestive heart failure.

Claim 16; Page 57-58; 101pp; English.

The sequence is that of human breast vascular endothelial growth factor D (VEGP-D). VEGP-D can be used for e.g. acceleration of angiogenesis in wound healing, tissue or organ transplantation, or to establish collateral circulation in tissue infarction or arterial stenosis, such as coronary artery disease, and inhibition of angiogenesis in the treatment of coronary artery disease, not inhibition of angiogenesis in the treatment of tung disorders to improve blood circulation in the lung and/or gascous exchange between the lungs and the blood stream or to improve blood circulation in the lungs and the blood stream or to improve blood circulation in the lungs of cardiac insufficiency, to improve blood flow and gascous exchange in che intestinal tract. Quantitation of VEGF-D in cancer blopsy in the intestinal tract. Quantitation of VEGF-D in cancer blopsy specimens may be useful as an indicator of future metastatic risk.

Changonists can be used for treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from increases in vascular permeability. The products can also be used confered to detection and diagnosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 4,

Sequence 13, Application US/08795430

Patent No. 6130071

GENERAL INFORMATION:

APPLICANT: Alitalo, Kari

APPLICANT: Joukov, Vladimir

TITLE OF INVENTION: Vascular Endothelial Growth Factor C (VEGF-C)

TITLE OF INVENTION: Protein and Gene, Mutants Thereof, and Uses Thereof

NUMBER OF SEQUENCES: 57

CORRESPONDENCE ADDRESS:

ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Borun

STREET: 6300 Sears Tower, 233 South Wacker Drive

CITY: Chicago

STATE: Illinois

COUNTRY: United States of America
                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
